# Introduction

Congratulations on your purchase of the WL-340/WL-341 Wireless Network Broadband Router. The WL-340/WL-341 is compliant with draft 802.11n v2.0 and up to 6 times faster than standard 802.11g based routers while still being compatible with 802.11g & 802.11b gadgets. The WL-340/WL-341 is not only a Wireless Access Point, but also doubles as a 4-port full-duplex Switch that connects your wired-Ethernet devices together.

At 300 Mbps wireless transmission rate, the Access Point built into the Router uses advanced MIMO (Multi-Input, Multi-Output) technology to transmit multiple streams of data in a single wireless channel, giving you seamless access to multimedia content. Robust RF signals travel farther, eliminating dead spots and extending network range. For data protection and privacy, the WL-340/WL-341 encodes all wireless transmissions with WEP, WPA, or WPA2 encryption.

With an inbuilt DHCP Server & powerful SPI firewall the WL-340/WL-341 protects your computers against intruders and most known Internet attacks but provides safe VPN pass-through. With the incredible speed and the QoS function of 802.11n(draft2.0), the WL-340/WL-341 is ideal for media-centric applications like streaming video, gaming, and VoIP telephony to run multiple media-intense data streams through the network at the same time, with no degradation in performance.

# **1 Key Features**

Features	Advantages
Incredible Data Rate up to	Heavy data payloads such as
300Mbps*	MPEG video streaming
IEEE 802.11n draft 2.0 Compliant	Fully Interoperable with IEEE
and backward compatible with	802.11b / IEEE802.11g compliant
802.11b/g	devices with legacy protection
Four 10/100 Mbps Fast Switch Ports	Scalability, extend your network.
(Auto-Crossover)	
Firewall supports Virtual Server	Avoids the attacks of Hackers from
Mapping, DMZ, IP Filter, ICMP	Internet.
Blocking, SPI.	
Support 802.1x authenticator,	Provide mutual authentication
802.11i (WPA/WPA2, AES), VPN	(Client and dynamic encryption
pass-through	keys to enhance security)

\* Theoretical wireless signal rate based on IEEE standard of 802.11a, b, g, n chipset used. Actual throughput may vary. Network conditions and environmental factors lower actual throughput rate. All specifications are subject to change without notice.

# 2 Package Contents

Open the package carefully, and make sure that none of the items listed below are missing. Do not discard the packing materials, in case of return; the unit must be shipped back in its original package.

- 1. WL-340/WL-341 Router
- 2. 220V~240V Power Adapter
- 3. Quick Install Guide
- 4. CD (User's Manual)
- 5. Warranty card
- 6. UTP cable

# 3 Product Layout

Port	Description
Power connector	Blinks on traffic for specific LAN PORT
	Connect the cable from you ADSL/Cable modem
WANLIENOW]	to this port
	Connect the cable from your PC's or network
LANLOIGY	devices to this port

# **Back label**

The back label describes the corresponding LED indications and port functionality.

LED	Description
POWER	Lights up when powered ON. Blinks on TEST/RESET
WLAN	Lights up in Blue when WLAN is enabled. Blinks on traffic
LINK/ACTIVY	Blinks on traffic for specific LAN PORT
WPS BUTTON	Press 2 seconds for WPS mode Press 10 seconds to reset the router Press 15 Seconds to reset the router to factory defaults.

# 4 Network + System Requirements

To begin using the WL-340/WL-341, make sure you meet the following as minimum requirements:

- PC/Notebook.
- Operating System Microsoft Windows XP/2000/VISTA.
- 1 Free Ethernet port.
- WiFi card/USB dongle (802.11 b/g/n) optional.
- External xDSL (ADSL) or Cable modem with an Ethernet port (RJ-45).
- PC with a Web-Browser (Internet Explorer, Safari, Firefox, Opera).
- Ethernet compatible CAT5 cables.

# 5 WL-340/WL-341 Placement

You can place the WL-340/WL-341 on a desk or other flat surface, or you can mount it on a wall. For optimal performance, place your Wireless Broadband Router in the center of your home (or your office) in a location that is away from any potential source of interference, such as a metal wall or microwave oven. This location must be close to a power connection and your ADSL/Cable modem.

# 6 Setup LAN, WAN

• Select the [General] tab.

a. WL-340/WL-341 supports [DHCP] function, please select both [Obtain an IP address automatically] and [Obtain DNS server address automatically].

# 8 Bringing up the WL-340/WL-341

Connect the supplied power-adapter to the power inlet port and connect it to a wall outlet. The WL-340/WL-341 automatically enters the self-test phase. During self-test phase, the Power LED will be lit continuously to indicate that this product is in normal operation.

# 9 Initial Setup WL-340/WL-341

# **LOGIN** procedure

1. Click to OPEN your browser (e.g. Internet Explorer).

2. Type <a href="http://192.168.0.1">http://192.168.0.1</a> in the address bar and press [Enter].

3. Type user name and password (default is admin/admin).

Connect to 192.168	.0.1
	GP

System Status DHCP Server Device Status Internet Status DHCP Status Log	
You can enable the Broadband routers DHCP server to dynamically allocate IP Addresses to your LAN client PCs. The broadband router must have an IP Address for the Local Area Network.	-
IP Nubnet Mask:         255:255:255:0	
DHCP Server: Enabled	
Lease Time : Two Days V	
Start IP: 192168.0.100	
End IP: 192.168.0.200	
Domain Name : Sitecom	
Apply Cancel	
ttp://192.168.0.1/lan.stm	

**<u>IP address</u>** 192.168.0.1. It is the router's LAN IP address (Your LAN clients default gateway IP address).

**<u>IP Subnet Mask</u>** 255.255.255.0 Specify a Subnet Mask for your LAN segment.

**DHCP Server** Enabled by default. You can enable or disable the DHCP server. When DHCP is disabled no ip-addresses are assigned to clients and you have to use static ip-addresses. When DHCP server is enabled your computers will be assigned an ip-address automatically until the lease time expires.

**Lease Time** Forever. In the Lease Time setting you can specify the time period that the DHCP lends an IP address to your LAN clients. The DHCP will change

your LAN client's IP address when this time threshold period is reached.

**<u>Start IP/End IP</u>** You can select a particular IP address range for your DHCP server to issue IP addresses to your LAN Clients.

### <u>Note</u>: default IP range 192.168.0.100 $\leftarrow \rightarrow$ 192.168.0.199. If you want your PC(s) to have a static/fixed IP address, then you'll have to choose an IP address outside this IP address Pool

**Domain Name** You can specify a Domain Name for your LAN. Or just keep the default (Sitecom).

Click **<Apply>** at the bottom of this screen to save any changes.

### **Device Status**

View the Broadband router's current configuration settings. Device Status displays the configuration settings you've configured in the Wizard / Basic Settings / Wireless Settings section.

Click **APPLY** to complete the configuration.

# **11 Wireless Settings**

You can set parameters that are used for the wireless stations to connect to this router. The parameters include Mode, ESSID, Channel Number and Associated Client.

# **Wireless Function**

Enable or Disable Wireless function here. Click **Apply** and wait for module to be ready & loaded.

### **Basic Settings**

**Band** Allows you to set the AP fixed at 802.11b or 802.11g mode. You can also select B+G mode to allow 802.11b and 802.11g clients at the same time.

**ESSID** This is the name of the wireless signal which is broadcasted. All the devices in the same wireless LAN should have the same ESSID.

**Channel** The channel used by the wireless LAN. All devices in the same wireless LAN should use the same channel.

**Channel Bandwidth** Allows you to choose the channel bandwidth 20 MHz or 20/40 MHz.

**Extension Channel** Allows you to select the extension channel when Channel bandwidth is set to 20/40 MHz.

### **Advanced Settings**

This tab allows you to set the advanced wireless options. The options included are Authentication Type, Fragment Threshold, RTS Threshold, Beacon Interval, and Preamble Type. You should not change these parameters unless you know what effect the changes will have on the router.

**Fragment Threshold** "Fragment Threshold" specifies the maximum size of a packet during the fragmentation of data to be transmitted. If you set this value too low, it will result in bad performance.

**RTS Threshold** When the packet size is smaller then the RTS threshold, the wireless router will not use the RTS/CTS mechanism to send this packet.

**Beacon Interval** is the interval of time that this wireless router broadcasts a beacon. A Beacon is used to synchronize the wireless network.

**Preamble Type** The "Long Preamble" can provide better wireless LAN compatibility while the "Short Preamble" can provide better wireless LAN performance.

**Broadcast ESSID** If you enabled "Broadcast ESSID", every wireless station located within the coverage of this access point can discover this access point easily. If you are building a public wireless network, enabling this feature is recommended. Disabling "Broadcast ESSID" can provide better security.

**802.11g protection:** It is recommended to enable the protection mechanism. This mechanism can decrease the rate of data collision between 802.11b and 802.11g wireless stations. When the protection mode is enabled, the throughput of the AP will be a little lower due to a lot of frame-network that is transmitted.

**WMM** WiFi Multi Media if enabled supports QoS for experiencing better audio, video and voice in applications.

# Security

This Access Point provides complete wireless LAN security functions, included are WEP, IEEE 802.11x, IEEE 802.11x with WEP, WPA with pre-shared key and WPA with RADIUS. With these security functions, you can prevent your wireless LAN from illegal access. Please make sure your wireless stations use the same security function, and are setup with the same security key.

#### Disable

When you choose to disable encryption, it is very insecure to operate the WL-341.

Enable Basic	Advanced Security ACL	WPS		11	
This page allows wireless network	you setup the wireless security. T	furn on WEP or WPA by u	sing Encryption Keys could pre	vent any unauthorized acc	ess to your
	Encryption : Disable				
Enable 802	.1x Authentication			Apply	Cancel

#### WEP

When you select 64-bit or 128-bit WEP key, you have to enter WEP keys to encrypt data. You can generate the key by yourself and enter it. You can enter four WEP keys and select one of them as a default key. Then the router can receive any packets encrypted by one of the four keys.

WEP or WPA by using Encryption Keys could prevent any unauthorized access to your	WPS m on WEP or WPA by using Encryption Keys could prevent any unauthorized access to your
WEP or WPA by using Encryption Keys could prevent any unauthorized access to your	wrs         m on WEP or WPA by using Encryption Keys could prevent any unauthorized access to your         v         erg) v

week or week by using encryption keys could prevent any unauthonzed access to your	n on vez- or wave by using entryption keys could prevent any unauthonzed access to your
	ee) 🗸
	ters) 💌

**Key Length** You can select the WEP key length for encryption, 64-bit or 128bit. The larger the key will be the higher level of security is used, but the throughput will be lower.

**Key Type** You may select ASCII Characters (alphanumeric format) or Hexadecimal Digits (in the "A-F", "a-f" and "0-9" range) to be the WEP Key.

**Key1 - Key4** The WEP keys are used to encrypt data transmitted in the wireless network. Use the following rules to setup a WEP key on the device. 64-bit WEP: input 10-digits Hex values (in the "A-F", "a-f" and "0-9" range) or 5-digit ASCII character as the encryption keys. 128-bit WEP: input 26-digit Hex values (in the "A-F", "a-f" and "0-9" range) or 13-digit ASCII characters as the encryption keys.

Click <Apply> at the bottom of the screen to save the above configurations. You can now configure other sections by choosing Continue, or choose Apply to apply the settings and reboot the device.

#### WPA Pre-shared Key

Wi-Fi Protected Access (WPA) is an advanced security standard. You can use a pre-shared key to authenticate wireless stations and encrypt data during communication. It uses TKIP or CCMP (AES) to change the encryption key frequently. So the encryption key is not easy to be cracked by hackers. This is the best security available.

Enable Bas	ic Advanced Se	curity ACL WPS

	Pre-sharedKey :		
			Apply Cancel

#### **WPA-Radius**

Wi-Fi Protected Access (**WPA**) is an advanced security standard. You can use an external RADIUS server to authenticate wireless stations and provide the session key to encrypt data during communication. It uses **TKIP** or **AES** to change the encryption key frequently. Press **Apply** button when you are done.

# ACL

This wireless router supports MAC Address Control, which prevents unauthorized clients from accessing your wireless network.

Enable wireless access control Enables the wireless access control function

Adding an address into the list Enter the "MAC Address" of the wireless station to be added and then click "Apply". The wireless station will now be added into the "MAC Address Filtering Table" below.

**Remove an address from the list** If you want to remove a MAC address from the "MAC Address Filtering Table", select the MAC address that you want to remove in the list and empty the fields.

Click **<Apply>** at the bottom of the screen to save the above configurations. You can now configure other sections by choosing Continue, or choose Apply to apply the settings and reboot the device.

#### **WPS**

Wi-Fi Protected Setup (WPS) is the simplest way to establish a connection between the wireless clients and the wireless router. You don't have to select the encryption mode and fill in a long encryption passphrase every time when you try to setup a wireless connection. You only need to press a button on both wireless client and wireless router, and WPS will do the rest for you.

The wireless router supports two types of WPS: WPS via Push Button and WPS via PIN code. If you want to use the Push Button, you have to push a specific button on the wireless client or in the utility of the wireless client to start the WPS mode, and switch the wireless router to WPS mode. You can simply push the WPS button of the wireless router, or click the 'Start to Process' button in the web configuration interface. If you want to use the PIN code, you have to know the PIN code of the wireless client and switch it to WPS mode, then fill-in the PIN code of the wireless client through the web configuration interface of the wireless router.

Nttp://192.168.0.1/wps.stm		<u>~</u>

**WPS** Check the box to enable WPS function and uncheck it to disable the WPS function.

**WPS Current Status** If the wireless security (encryption) function of this wireless router is properly set, you'll see a 'Configured' message here. Otherwise, you'll see 'UnConfigured'.

**Self Pin Code** This is the WPS PIN code of the wireless router. You may need this information when connecting to other WPS-enabled wireless devices.

**SSID** This is the network broadcast name (SSID) of the router.

**Authentication Mode** It shows the active authentication mode for the wireless connection.

**Passphrase Key** It shows the passphrase key that is randomly generated by the wireless router during the WPS process. You may need this information when using a device which doesn't support WPS.

**WPS via Push Button** Press the button to start the WPS process. The router will wait for the WPS request from the wireless devices within 2 minutes.

**WPS via PIN** You can fill-in the PIN code of the wireless device and press the button to start the WPS process. The router will wait for the WPS request from the wireless device within 2 minutes.

# **12 Firewall Settings**

The Broadband router provides extensive firewall protection by restricting connection parameters, thus limiting the risk of hacker attacks, and defending against a wide array of common Internet attacks. However, for applications that require unrestricted access to the Internet, you can configure a specific client/server as a Demilitarized Zone (DMZ).

Note: To enable the Firewall settings select Enable and click Apply

### DMZ

If you have a client PC that cannot run an Internet application (e.g. Games) properly from behind the NAT firewall, then you can open up the firewall restrictions to unrestricted two-way Internet access by defining a DMZ Host. The DMZ function allows you to re-direct all packets going to your WAN port IP address to a particular IP address in your LAN. The difference between the virtual server and the DMZ function is that the virtual server re-directs a particular service/Internet application (e.g. FTP, websites) to a particular LAN client/server, whereas DMZ re-directs all packets (regardless of services) going to your WAN IP address to a particular LAN client/server.

Click **<Apply>** at the bottom of the screen to save the above configurations.

# **Denial of Service (DoS)**

The Broadband router's firewall can block common hacker attacks, including Denial of Service, Ping of Death, Port Scan and Sync Flood. If Internet attacks occur the router can log the events.

**SPI and Anti-Dos firewall protection** blocks basic hacker attacks (DOS, Sync flood, port scan)

**RIP defect** Allows the user to choose if the router should respond to other RIP compliant devices.

**Discard Ping to WAN interface** The router's WAN port will not respond to any Ping requests.

**Stateful packet inspection** allows the user to manually determine which packets should be scanned.

**E-mail Alert** Enter your email address. Specify your SMTP and POP3 servers, user name, and password.

**Connection Policy** Enter the appropriate values for TCP/UDP sessions as described in the following table.

### Access

You can restrict users from accessing certain Internet applications/services (e.g. Internet websites, email, FTP etc.), Access Control allows users to define the traffic type permitted in your LAN. You can control which PC client can have access to these services.

# **13 Advanced Settings**

Network Address Translation (NAT) allows multiple users at your local site to access the Internet through a single Public IP Address or multiple Public IP Addresses. NAT provides Firewall protection from hacker attacks and has the flexibility to allow you to map Private IP Addresses to Public IP Addresses for key services such as Websites and FTP. Select Disable to disable the NAT function.

#### **Virtual Server**

Use the Virtual Server function when you want different servers/clients in your LAN to handle different service/Internet application type (e.g. Email, FTP, Web server etc.) from the Internet. Computers use numbers called port numbers to recognize a particular service/Internet application type. The Virtual Server allows you to re-direct a particular service port number (from the Internet/WAN Port) to a particular LAN private IP address and its service port number.

**Trigger Port** This is the out going (Outbound) range of port numbers for this particular application.

**Trigger Type** Select whether the outbound port protocol is "TCP", "UDP" or both.

**Public Port** Enter the In-coming (Inbound) port or port range for this type of application (e.g. 2300-2400, 47624)

Public Type Select the Inbound port protocol type: "TCP", "UDP" or both

**Enable** Trigger Port Enable the Special Application function.

**Popular applications** This section lists the more popular applications that require multiple connections. Select an application from the Popular Applications selection. Once you have selected an application, select a location (1-10) in the Copy to selection box and then click the Copy to button. This will automatically list the Public Ports required for this popular application in the location (1-10) you specified.

### UPNP

With UPnP, all PCs in you Intranet will discover this router automatically. So, you don't have to configure your PC and it can easily access the Internet through this router.

**UPnP** You can enable or Disable the UPnP feature here. After you enable the UPnP feature, all client systems that support UPnP, like Windows XP, can discover this router automatically and access the Internet through this router without having to configure anything. The NAT Traversal function provided by UPnP can let applications that support UPnP connect to the internet without having to configure the virtual server sections.

### QoS

QoS can let you classify Internet application traffic by source/destination IP address and port number. You can assign priority for each type of application and reserve bandwidth for it. The packets of applications with higher priority will always go first. Lower priority applications will get bandwidth after higher priority applications get enough bandwidth. This can let you have a better experience in using critical real time services like Internet phone, video conference ...etc. All the applications not specified by you are classified as rule name "Others". The rule with a smaller priority number has a higher priority; the rule with a larger priority number has a lower priority. You can adjust the priority of the rules by moving them up or down.

**Enable/Disable QoS** You can check "Enable QoS" to enable QoS functionality for the WAN port.

**Traffic mapping** Click "Add traffic class" then enter a form of the QoS rule. Click "Apply" after filling out the form the rule will be added into the table.

**Edit a QoS rule** Select the rule you want to edit and click "Edit", then enter the detail form of the QoS rule. Click "**Apply**" after editing the form and the rule will be saved.

**Adjust QoS rule** priority. You can select the rule and click "Move Up" to make its priority higher. You also can select the rule and click "Move Down" to make its priority lower.

### Routing

These screens define routing related parameters, including static routes and RIP (Routing Information Protocol) parameters.

**SNMP operation mode** to select the SNMP modes for this device.

**Community** A computer attached to the network, called a Network Management Station (NMS), can be used to access this information. Access rights to the agent are controlled by community strings. To communicate with the Router, the NMS must first submit a valid community string for authentication. Note: Up to five community names may be entered.

**Note:** Up to five community names may be entered.

**Trap** Specify the IP address of the NMS to notify when a significant event is detected by the agent. When a trap condition occurs, the SNMP agent sends an SNMP trap message to any NMS specified as a trap receiver. IP Address Traps are sent to this address when errors or specific events occur on the network. Community A community string (password) specified for trap management. Enter a word, something other than public or private, to prevent unauthorized individuals from accessing information on your system. Version Sets the trap status to disabled, or enabled with V1 or V2c. The v2c protocol was proposed in late 1995 and includes enhancements to v1 that are universally accepted.

retrieving a sequence of MIB variables, and a more elaborate set of error codes for improved reporting to A Network Management Station.

# **14 TOOLBOX Settings**

### **Password change options**

You can change the password required to log into the broadband router's system web-based management. By default, the password is: admin. Passwords can contain 0 to 12 alphanumeric characters, and are case sensitive.

**Current Password** Fill in the current password to allow changing to a new password.

New Password Enter your new password

**Confirmed Password** Enter your new password again for verification purposes

Click **<Apply>** at the bottom of the screen to save the above configurations

**Set Time Zone** Select the time zone of the country you are currently in. The router will set its time based on your selection.

Time Server Address You can set an NTP server address.

**Enable Daylight Savings** The router can also take Daylight savings into account. If you wish to use this function, you must check/tick the enable box to enable your daylight saving configuration (below).

**Start Daylight Savings Time** Select the period in which you wish to start daylight Savings Time.

**End Daylight Savings** Time Select the period in which you wish to end daylight Savings Time.

Click **<Apply>** at the bottom of the screen to save the above configurations.

### **Remote Management**

The remote management function allows you to designate a host in the Internet the ability to configure the Broadband router from a remote site. Enter the designated host IP Address in the Host IP Address field.

**Host Address** This is the IP address of the host in the Internet that will have management/configuration access to the Broadband router from a remote site. If the Host Address is left 0.0.0.0 this means anyone can access the router's web-based configuration from a remote location, providing they know the password.

**Port** The port number of the remote management web interface.

**Enable** Select "**Enable**" to enable the remote management function.

Click **<Apply>** at the bottom of the screen to save the above configurations.

### **Firmware Upgrade**

This page allows you to upgrade the router's firmware.

**Firmware Upgrade** This tool allows you to upgrade the Broadband router's system firmware. To upgrade the firmware of your Broadband router, you need to download the firmware file to your local hard disk, and enter that file name and path in the appropriate field on this page. You can also use the Browse button to find the firmware file on your PC.

Once you've selected the new firmware file, click **<Apply>** at the bottom of the screen to start the upgrade process

# **Backup Settings**

The Backup screen allows you to save (Backup) the router's current configuration settings. When you save the configuration setting (Backup) you can re-load the saved configuration into the router through the Restore selection. If extreme problems occur you can use the Restore to Factory Defaults selection, this will set all configurations to its original default settings (e.g. when you first purchased the router).

Use the "Backup" tool to save the Broadband router current configuration to a file named "**config.bin**" on your PC. You can then use the "Restore" tool to restore the saved configuration to the Broadband router. Alternatively, you can use the "Restore to Factory Defaults" tool to force the Broadband router to perform a power reset and restore the original factory settings.

### Reset

You can reset the router's system should any problem exist. The reset function essentially re-boots your router's system.

### DDNS

DDNS allows you to map the static domain name to a dynamic IP address. You must get an account, password and your static domain name from the DDNS service providers. This router supports DynDNS, TZO and other common DDNS service providers.
